LinkedIn | GitHub | Portfolio

Professional Summary

Cloud and DevOps Engineer with 3 years of experience in cloud infrastructure, CI/CD automation, Infrastructure as Code, and containerization. Skilled in AWS, Terraform, Docker, Kubernetes, Jenkins, GitHub Actions, and Linux. Hands-on experience building and deploying cloud-based applications, automating infrastructure, implementing CI/CD workflows, and working with Kubernetes deployment and monitoring technologies.

Technical Skills

Cloud Platform: AWS (EC2, VPC, IAM, S3, Route 53, ALB, CloudWatch, CloudFront, RDS, DynamoDB)

Infrastructure as Code: Terraform, AWS CloudFormation

Containers & Orchestration: Docker, Kubernetes, Amazon ECS, Amazon EKS

CI/CD & GitOps: Jenkins, GitHub Actions, Argo CD, Maven, SonarQube, Nexus Repository Manager

Monitoring & Logging: Amazon CloudWatch, Prometheus, Grafana, Splunk

Configuration Management: Ansible

Version Control: Git, GitHub

Operating Systems: Linux, Windows

Programming & Scripting: Shell, Python

Application Server: Apache Tomcat

Professional Experience

Fourp Technology Solutions

Chennai, Tamil Nadu

Software Engineer

July 2023 – Present

- Designed, provisioned, and managed **AWS cloud infrastructure using Terraform**, including VPCs, public/private subnets, route tables, Internet Gateway, NAT Gateway, EC2, security groups, IAM, and container infrastructure.
- Implemented secure and scalable **3-tier AWS architectures** across web, application, and database tiers using services such as S3, CloudFront, API Gateway, VPC Link, Application Load Balancer, ECS Fargate, EKS, and RDS PostgreSQL.
- Developed and maintained **CI/CD pipelines using Jenkins**, automating source-code checkout, Maven/Node.js builds, unit testing, SonarQube analysis, Docker image creation, and deployments to AWS ECS and EKS, which **reduced deployment cycle times by 30%**.
- Containerized applications using Docker, managed container images in Amazon ECR, and configured ECS Task Definitions, Services, and Fargate deployments.
- Deployed and managed Kubernetes workloads on Amazon EKS, creating Kubernetes manifests and Helm charts, configuring Deployments, Services, ConfigMaps, Secrets, and Ingress for application routing.
- Configured API Gateway with VPC Link and internal ALB to securely route requests to private backend services without directly exposing application servers to the internet.
- Hosted static frontend applications using Amazon S3 and CloudFront, implementing Origin Access Control and integrating Route 53 and ACM for DNS management and HTTPS.
- Deployed and supported a 3-tier Learning Management System consisting of React frontend, Node.js backend, and PostgreSQL database on AWS, using Nginx as a reverse proxy and PM2 for Node.js process management.
- Troubleshoot CI/CD failures, Docker/container issues, Kubernetes deployments, AWS networking, application connectivity, Linux services, and production deployment issues in collaboration with development teams.
- Worked in an Agile/DevOps environment, participating in deployments, requirement discussions, incident troubleshooting, root-cause analysis, and continuous improvement of development and release processes.

Key Projects

GitOps-Based Kubernetes Deployment & Monitoring

- Technologies:** AWS EKS, Kubernetes, Docker, GitHub, Argo CD, Prometheus, Grafana, Splunk.
- Provisioned the underlying AWS environment with modular Terraform (VPC, subnet, security group, and compute modules) reused across dev and prod through input variables and workspaces, **cutting environment provisioning time in half**, with remote state in Amazon S3 and state locking; used terraform import and data sources to bring existing resources under management.
- Ran Terraform through a GitHub Actions pipeline that authenticated to AWS via OIDC federation instead of static credentials, executing **terraform init, validate, and plan** on pull requests prior to deployment.

- Provisioned Amazon EKS clusters and managed node groups with eksctl, deploying a multi-service Node.js/React application using Deployment, Service, ConfigMap, and Secret manifests with an ALB Ingress for internet-facing routing.
- Packaged the workloads as Helm charts with environment-specific values files so the same release could target dev and prod without manifest duplication.
- Layered GitOps delivery on top using Argo CD: Application resources tracked a Git repository path and auto-synced on change, so deployments were driven by Git commits rather than manual kubectl/Helm runs, giving an auditable history and rollback via Git revert.
- Closed the loop with observability — Prometheus for metrics collection and Grafana dashboards for pod/node health and application performance, plus a Fluent Bit DaemonSet (ServiceAccount, ClusterRole, ClusterRoleBinding) forwarding container logs from every node to Amazon CloudWatch Logs and Splunk for centralized aggregation and search.

Cloud-Native Microservices

- **Technologies:** AWS ECS Fargate, API Gateway, Cognito, S3, CloudFront, RDS PostgreSQL, DynamoDB, SNS, SQS, Terraform, Docker.
- Built a multi-tier AWS VPC (public, private-ECS, and private-DB subnets) with NAT/Internet Gateway and multi-AZ route tables for a containerized microservices application.
- Deployed backend microservices on Amazon ECS (Fargate) behind an internal ALB with path-based routing, exposed through Amazon API Gateway using VPC Link and a Cognito JWT authorizer.
- Used Amazon RDS (PostgreSQL) for transactional data, DynamoDB for product/cart data, S3 + CloudFront for static frontend hosting, and Parameter Store for configuration; wired up SNS/SQS for order notifications.

Certifications

- AWS Certified Cloud Practitioner (CLF-C02)

Education

ABN PRR College Of Science

Bachelor of Science in Computer Science – CGPA: 7.5/10

September 2020 – October 2023

Kovvur, India

Languages

English, Telugu
